

Product Data Sheet:

resi-METAL

Metallic Resin Art Pigments

resi-METAL solvent free pigment pastes were specifically developed to be combined with our range of polymer art resins to create beautiful resin artwork

- Solvent Free
- Colour fast
- Suitable for epoxy, polyester & polyurethane resin systems
- Can be used in conjunction with our resi-TINT range of acrylic pigments
- Supplied in 100g pots
- 5 colours

This range can be used to colour most polymer resin systems used within the arts, crafts, flooring and coating industries. A selection of 5 colours that are quick and easy to use. The metallic colour is locked in once the resin system has cured.

Even a tiny addition rate will transform clear resins into shimmering metallic colours without interrupting or altering the resin's curing cycle or cured properties. They have a significantly improved resistance to fading compared to conventional metal flakes and powders as well as excellent storage stability and water resistance.

The pigments are solvent free and disperse uniformly and rapidly into clear unfilled epoxy, polyester and polyurethane resins, varnishes, gel coats, paints and sealers. The colour range was carefully selected for colour fastness, blend rate, opacity, heat stability and having the minimum effect on the setting characteristics of the final resin system.

HOW TO USE IT:

Mixing & Application

The recommended addition amount to resin is 2%-5% by weight (between 2-5 parts resi-METAL per 100 parts resin). Add to the resin mix as required.

SAFETY:

Refer to the Material Safety Data Sheet for information on correct handling and application of the product.
